## CMSC201

## Computer Science I for Majors

## Lecture 02 - Algorithmic Thinking

## Prof. Jeremy Dixon

## Last Class We Covered

- Syllabus
- Grading scheme, expectations, etc.
- Academic Integrity Policy
- Computer System Components
- Binary numbers
- Converting between binary and decimal
- Algorithmic thinking
- Making sandwiches for aliens

Any Questions from Last Time?

## Today's Objectives

- To practice thinking algorithmically
- To understand and be able to implement proper program development
- To start learning about control structures
- To be able to express an algorithm using a flow chart

## What is an Algorithm?

- Steps used to solve a problem
- Problem must be
- Well defined
- Fully understood by the programmer
- Steps must be
- Ordered
- Unambiguous
- Complete

## Developing an Algorithm

## Program Development

1. Understand the problem
2. Represent your solution (your algorithm)

- Pseudocode
- Flowchart

3. Implement the algorithm in a program
4. Test and debug your program

## Step 1: Understanding the Problem

- Input
- What information or data are you given?
- Process
- What must you do with the information/data?
- This is your algorithm!
- Output
- What are your deliverables?

## "Weekly Pay" Example

- Create a program to calculate the weekly pay of an hourly employee
- What is the input, process, and output?
- Input: pay rate and number of hours
- Process: multiply pay rate by number of hours
- Output: weekly pay

## Step 2: Represent the Algorithm

- Can be done with flowchart or pseudocode
- Flowchart

- Symbols convey different types of actions
- Pseudocode
- A cross between code and plain English
- One may be easier for you - use that one

## Step 2A: Pseudocode

- Start with a plain English description, then...

1. Variables: hours, rate, pay
2. Display "Number of hours worked: "
3. Get hours
4. Display "Amount paid per hour: "
5. Get rate
6. pay = hours * rate
7. Display "The pay is $\$$ " , pay

## Flowchart Symbols

Decision Symbol
End Symbol

End

## Step 2B: Flowchart

Steps 3 and 4: Implementation and Testing/Debugging

- We'll cover implementation in detail next class
- Testing and debugging your program involves identifying errors and fixing them
-We'll talk about this later today

## Algorithms and Language

- Notice that developing the algorithm didn't involve any Python at all
- Only pseudocode or a flowchart was needed
-An algorithm can be coded in any language
- All languages have 3 important control structures we can use in our algorithms

## Control Structures

## Control Structures

- Structures that control how the program "flows" or operates, and in which order
- Sequence
- Decision Making
- Looping

## Sequence

- One step after another, with no branches
- Already wrote one for "Weekly Pay" problem
- What are some real life examples?
- Dialing a phone number
- Purchasing and paying for groceries

## Decision Making

- Selecting one choice from many based on a specific reason or condition
- If something is true, do $\boldsymbol{A}$... if it's not, do $\boldsymbol{B}$
- What are some real life examples?
- Walking around campus (construction!)
- Choosing where to eat for lunch

## Decision Making: Pseudocode

- Answer the question "Is a number positive?"
- Start with a plain English description

1. Variable: num
2. Display "Enter the number: "
3. Get num
4. If num >0
5. Display "It is positive"
6. Else
7. Display "It is negative"

## Decision Making: Flowchart

## Looping

- Doing something over and over again
- Combined with decision making
- Otherwise we loop forever (an "infinite loop")
- What are some real life examples?
- Doing homework problem sets
- Walking up steps

## Looping: Pseudocode

- Write an algorithm that counts from 1-20
- Start with a plain English description

1. Variable: num
2. num $=1$
3. While num <= 20
4. Display num
5. num $=$ num +1
6. (End loop)

## Looping: Flowchart

## Looping: Flowchart

## Looping: Flowchart

## Debugging

## A Bit of History on "Bugs"

- US Navy lab - September 9, 1947
- Grace Hopper and colleagues are working on the Harvard Mark II
- Or trying to... it wasn't working right
- They found a literal bug inside the machine
- Taped the bug (a moth) into their log book

## Errors ("Bugs")

- Two main classifications of errors
- Syntax errors
- Prevent Python from understanding what to do
- Logical errors
- Cause the program to run incorrectly, or to not do what you want

## Syntax Errors

- "Syntax" is the set of rules followed by a computer programming language
- Similar to grammar and spelling in English
- Examples of Python's syntax rules:
- Keywords must be spelled correctly

True and False, not Ture or Flase or Truu

- Quotes and parentheses must be closed: ("Open and close")

## Syntax Error Examples

- Find the errors in each line of code below:

1 prnit("Hello")
2 print("What"s up? ")
3 print("Aloha!)
4 print("Good Monring")

## Syntax Error Examples

- Find the errors in each line of code below:

1 prnit "Hello")
2 print("What"s up? ")
3 print("Alohe! )
4 print("GoodMonring")
not actually a syntax error

## Logical Errors

- Logical errors don't bother Python at all... they only bother you!
- Examples of logical errors:
- Using the wrong value for something callMe = "maybe NOT"
- Doing steps in the wrong order
- "Put jelly on bread. Open jelly jar."

## Exercise

- Write an algorithm that asks a user for their name, then responds with "Hello <NAME>"
- You can use a flowchart or pseudocode

Flow Control

## Exercise \#2

- Write an algorithm that asks a user for their grade, and tells them their letter grade.
A: 100-90
C: $80-70$
F: 60-0
B: 90-80
D: 70-60

End

Flow Control

## Announcements

- Your Lab 1 is an online lab this week!
- Due by this Thursday (Sept 3rd) at 8:59:59 PM
- Homework 1 is also out
- Due by next Tuesday (Sept 8th) at 8:59:59 PM
- Both of these assignments are on Blackboard
